

Beta

Crossing the chasm with {"no":"SQL"}

Akmal B. Chaudhri

(艾克摩 曹理)

Abstract

This presentation will discuss the reasons for the rise and development of NoSQL technology, and compare and contrast the alternative approaches. It will also look back at previous generations of database systems over the past 20 years and assess how they have fared commercially and whether NoSQL vendors can learn anything from history to avoid the same mistakes and pitfalls. Looking ahead, this presentation will also discuss some future directions for NoSQL technology.

Agenda

In a packed program ...

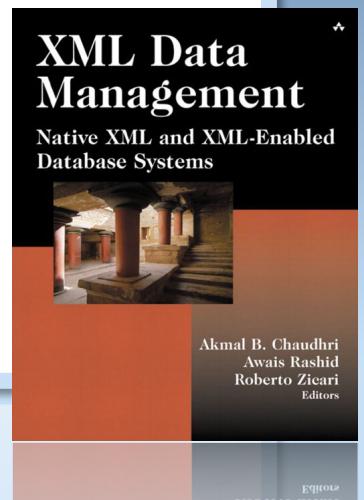

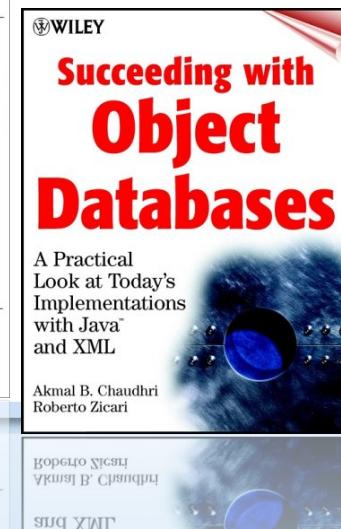

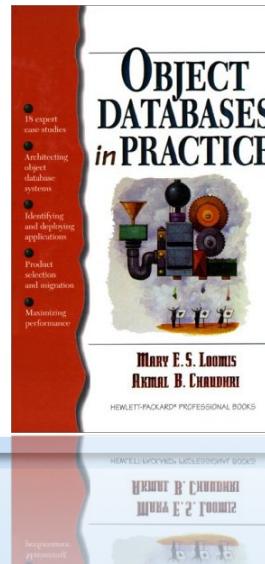

- Introduction
- NoSQL
- History repeats itself
- Market analysis
- Polyglot persistence
- NoSQL alternatives
- Summary
- Resources

Introduction

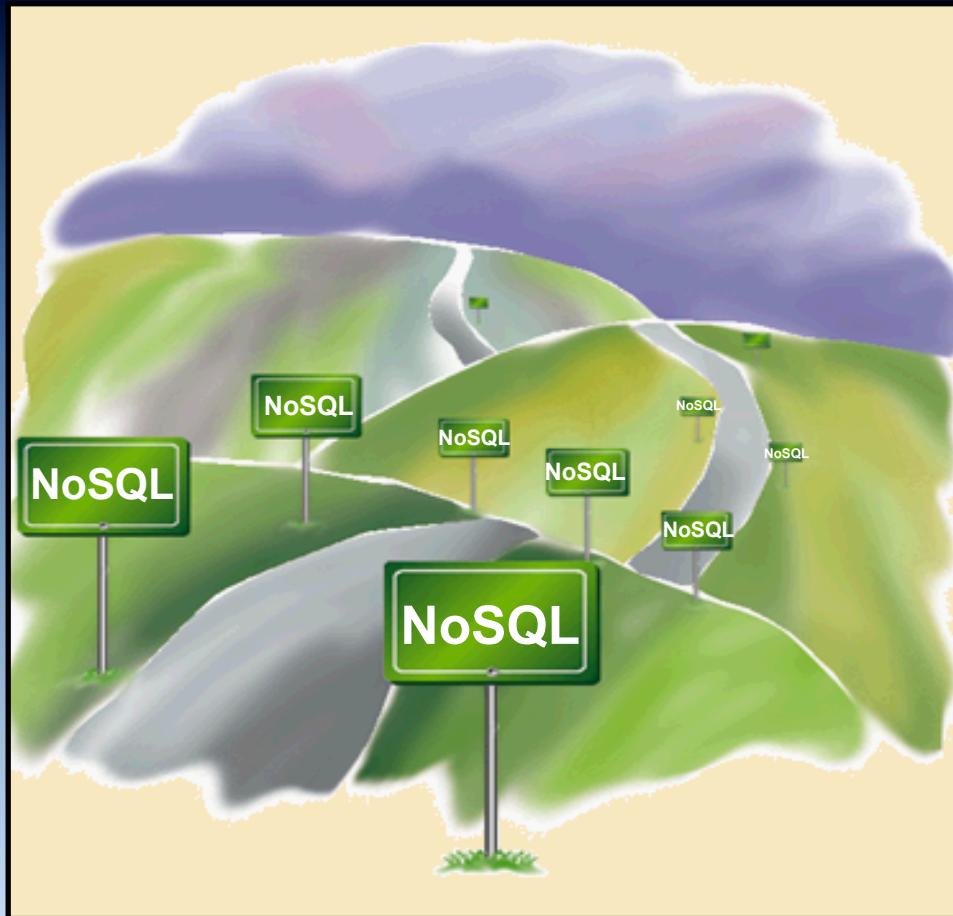

My background

- ~25 years experience in IT
 - Developer (Reuters)
 - Academic (City University)
 - Consultant (Logica)
 - Technical Architect (CA)
 - Senior Architect (Informix)
 - Senior IT Specialist (IBM)
 - TI (Hortonworks)
- Broad industry experience
- Worked with various technologies
 - Programming languages
 - IDE
 - Database Systems
- Client-facing roles
 - Developers
 - Senior executives
 - Journalists
- Community outreach
- 10 books, many presentations

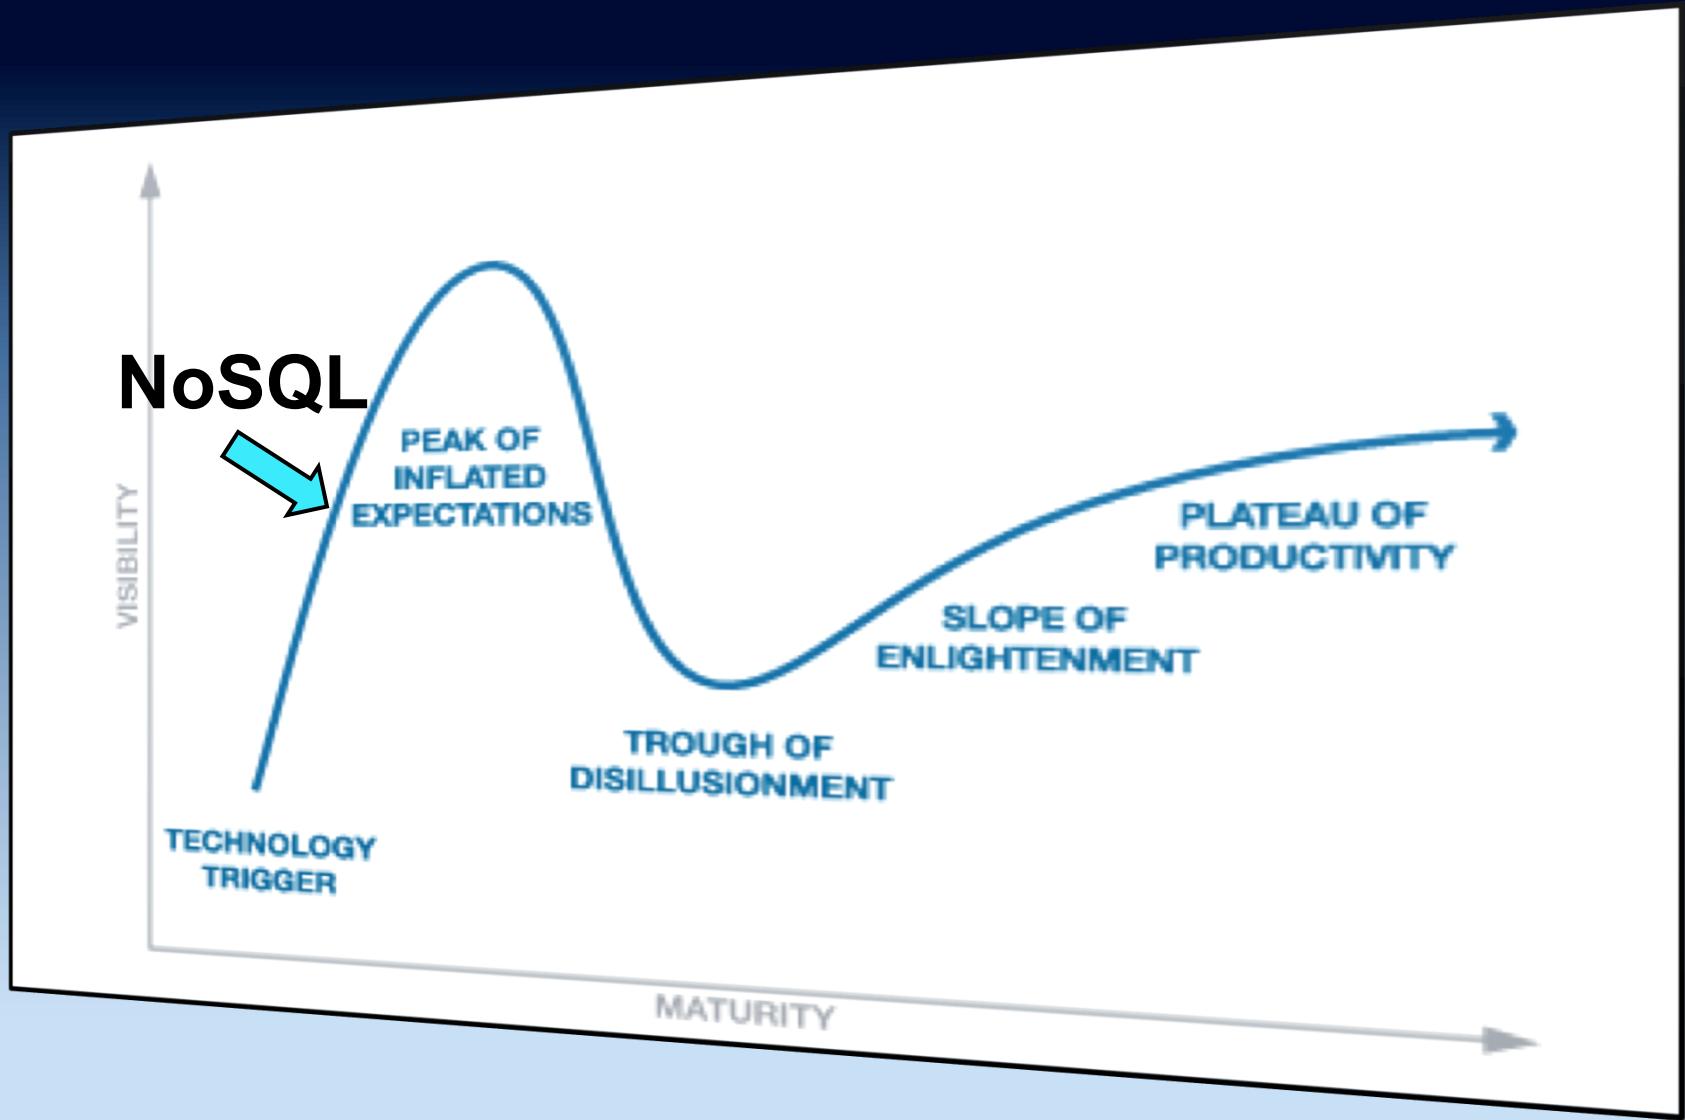

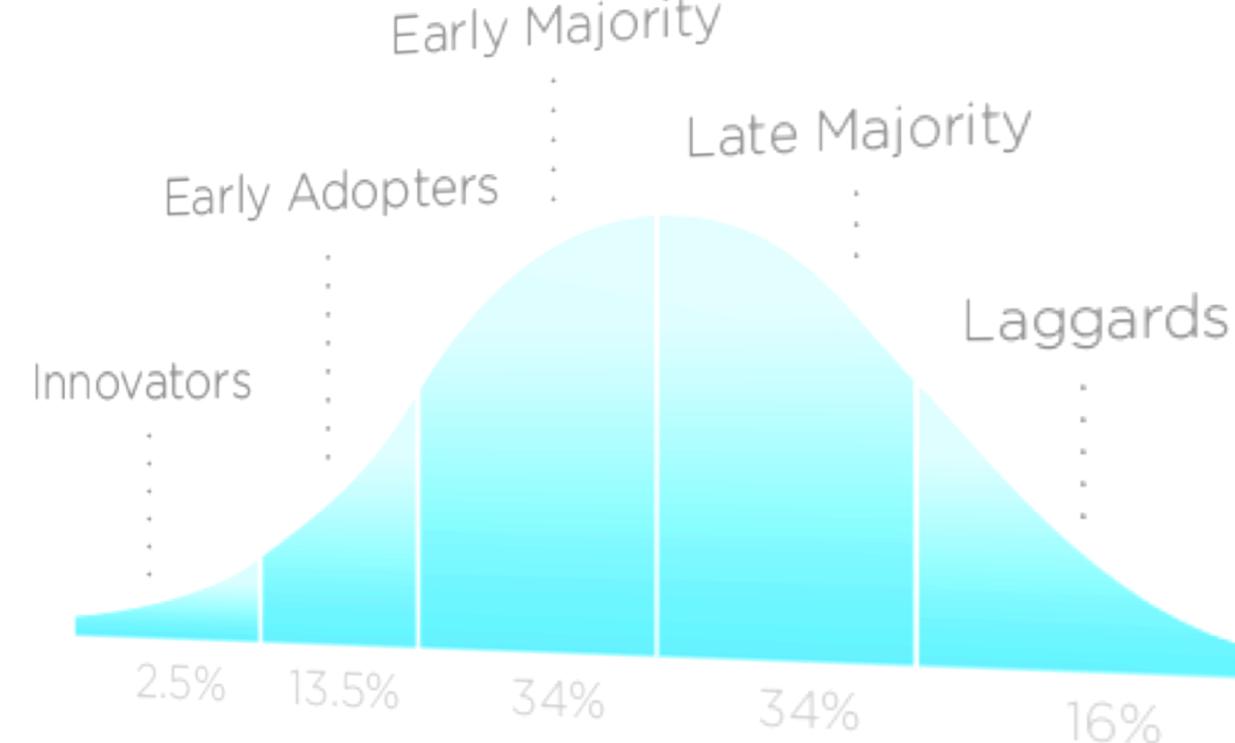

Your road leads to NoSQL?

Gartner hype curve

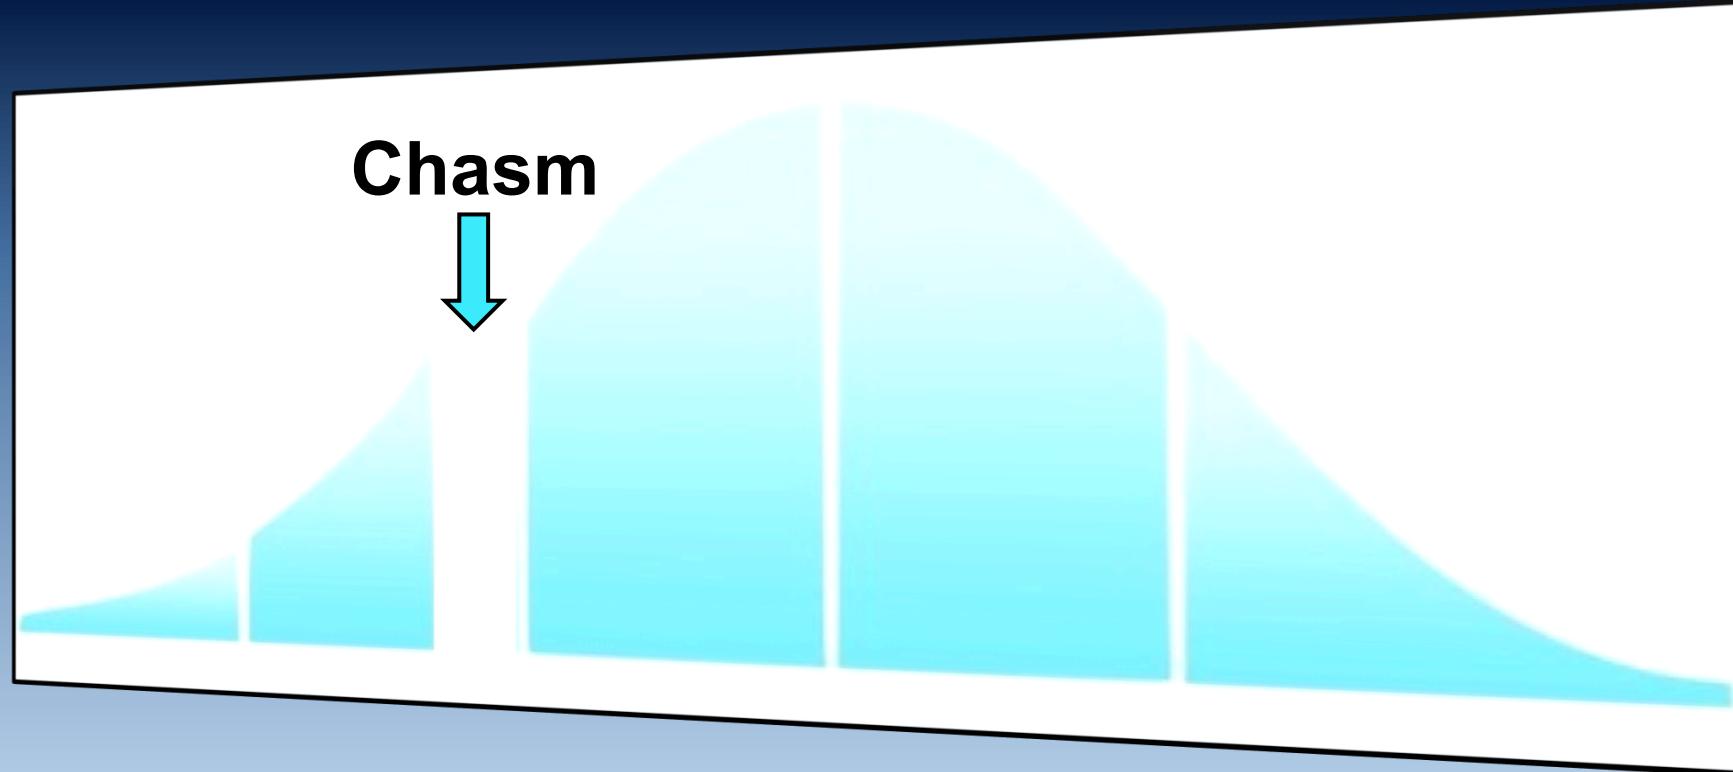

Innovation adoption lifecycle

INNOVATION ADOPTION LIFECYCLE

Source: http://en.wikipedia.org/wiki/Technology_adoption_lifecycle

Crossing the chasm

Magic quadrant

The screenshot shows the cover page of the Gartner Magic Quadrant for Operational Database Management Systems, dated 21 October 2013. The page features a blue header with the Gartner logo and a 'LICENSED FOR DISTRIBUTION' notice. Below the header, the title 'Magic Quadrant for Operational Database Management Systems' is displayed in green. The main content area includes a summary paragraph about the evolving DBMS market, the names of the analysts (Donald Feinberg, Merv Adrian, Nick Heudecker), and a 'VIEW SUMMARY' button. To the right, there's a promotional box for Gartner services and a table of acronyms and glossary terms.

LICENSED FOR DISTRIBUTION

Gartner.

Magic Quadrant for Operational Database Management Systems

21 October 2013 ID:G00251780

Analyst(s): Donald Feinberg, Merv Adrian, Nick Heudecker

VIEW SUMMARY

The operational DBMS market (formerly OLTP) is evolving dramatically, with new, innovative entrants and incumbents supporting the growing use of unstructured data and NoSQL DBMS engines. Information management leaders must understand the market implications affecting DBMS technology decisions.

Learn how Gartner can help you succeed

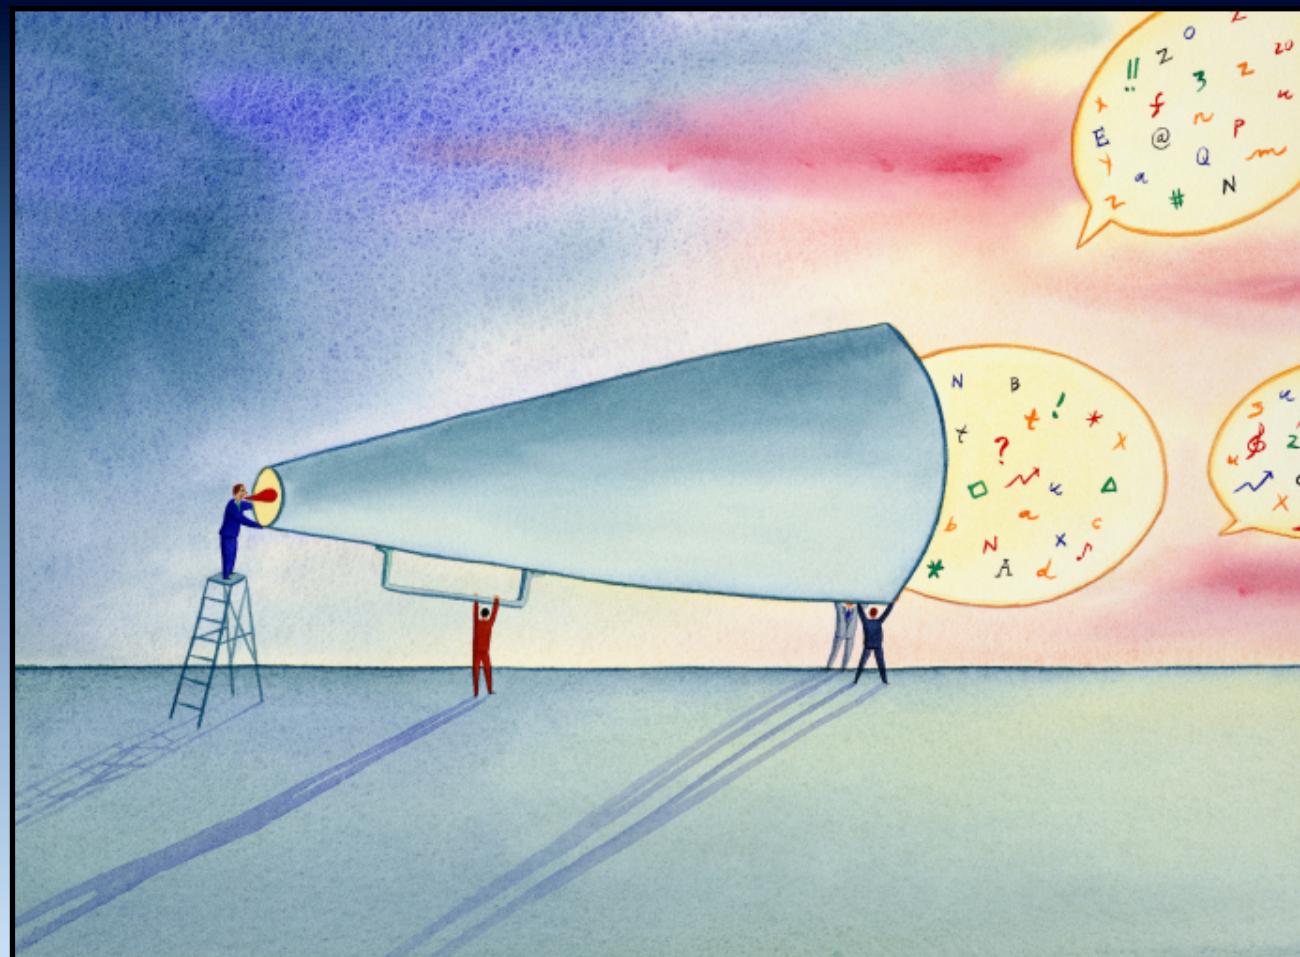

Become a Client now ▶

ACRONYM KEY AND GLOSSARY TERMS

ACID	atomicity, consistency, isolation and durability
ASE	Adaptive Server Enterprise
AWS	Amazon Web Services
DBMS	database management system

NoSQL

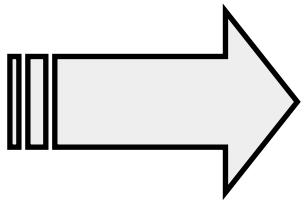

History

Have you run into limitations with traditional relational databases? Don't mind trading a query language for scalability? Or perhaps you just like shiny new things to try out? Either way this meetup is for you.

Join us in figuring out why these new fangled Dynamo clones and BigTables have become so popular lately.

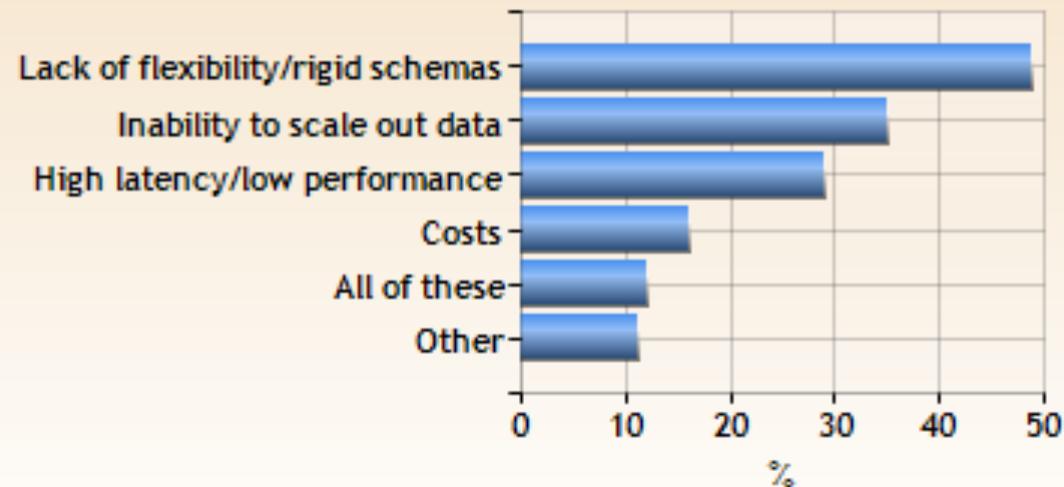

**Not
Only SQL**

Why did NoSQL datastores arise?

- Some applications need very few database features, but need high scale
- Desire to avoid data/schema pre-design altogether for simple applications
- Need for a low-latency, low-overhead API to access data
- Simplicity -- do not need fancy indexing -- just fast lookup by primary key

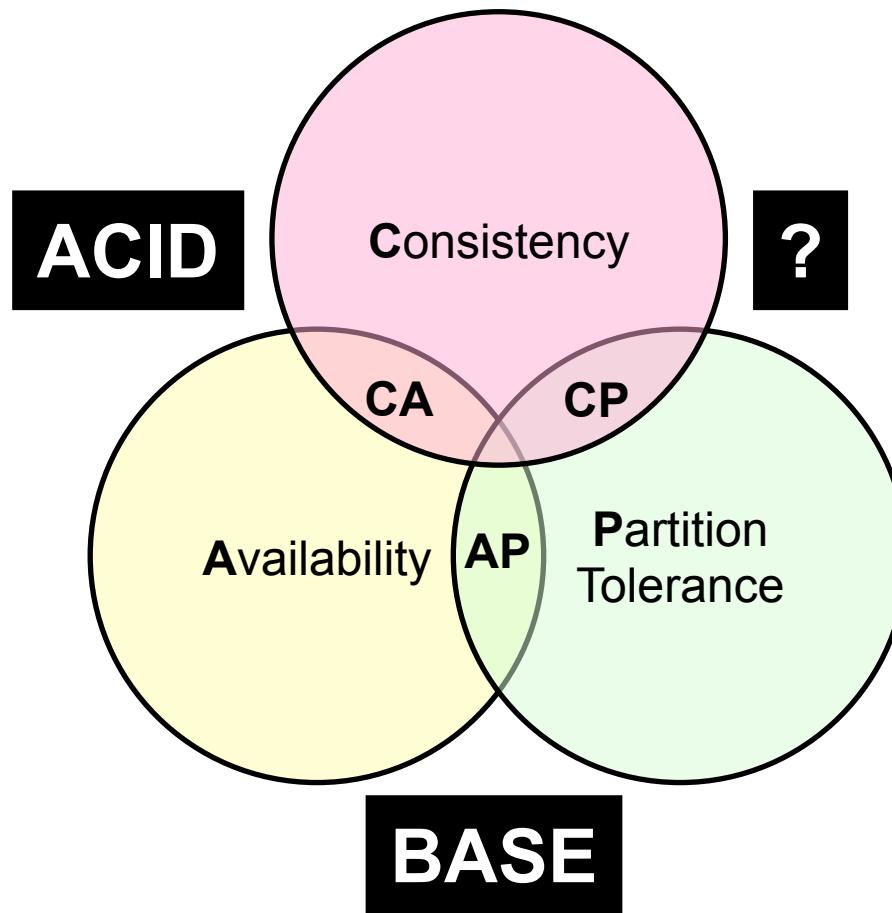

NoSQL drivers

What is the biggest data management problem driving your use of NoSQL in the coming year?

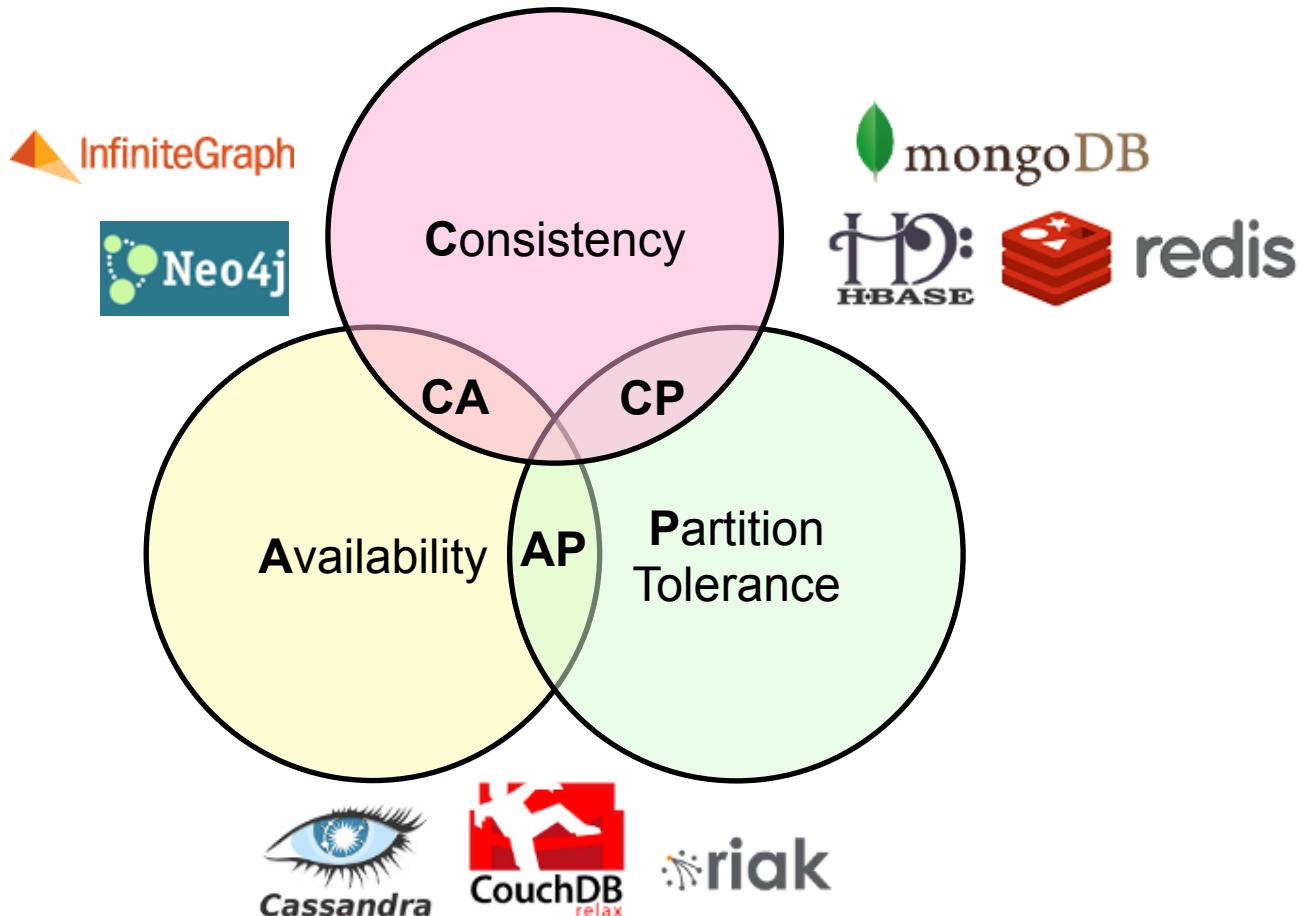

Source: Couchbase NoSQL Survey (December 2011)

Brewer's CAP Theorem ...

Brewer's CAP Theorem

ACID vs. BASE ...

- Atomicity
- Consistency
- Isolation
- Durability
- Basically Available
- Soft state
- Eventual consistency

ACID vs. BASE

ACID	BASE
<ul style="list-style-type: none">• Strong consistency• Isolation• Focus on “commit”• Nested transactions• Conservative (pessimistic)• Availability• Difficult evolution	<ul style="list-style-type: none">• Weak consistency• Availability first• Best effort• Approximate answers OK• Aggressive (optimistic)• Simpler, faster• Easier evolution

Source: After “Towards Robust Distributed Systems” Eric Brewer (2000)

But ...

... we find developers spend a significant fraction of their time building extremely complex and error-prone mechanisms to cope with eventual consistency and handle data that may be out of date. We think this is an unacceptable burden to place on developers and that consistency problems should be solved at the database level.

Tuneable CAP

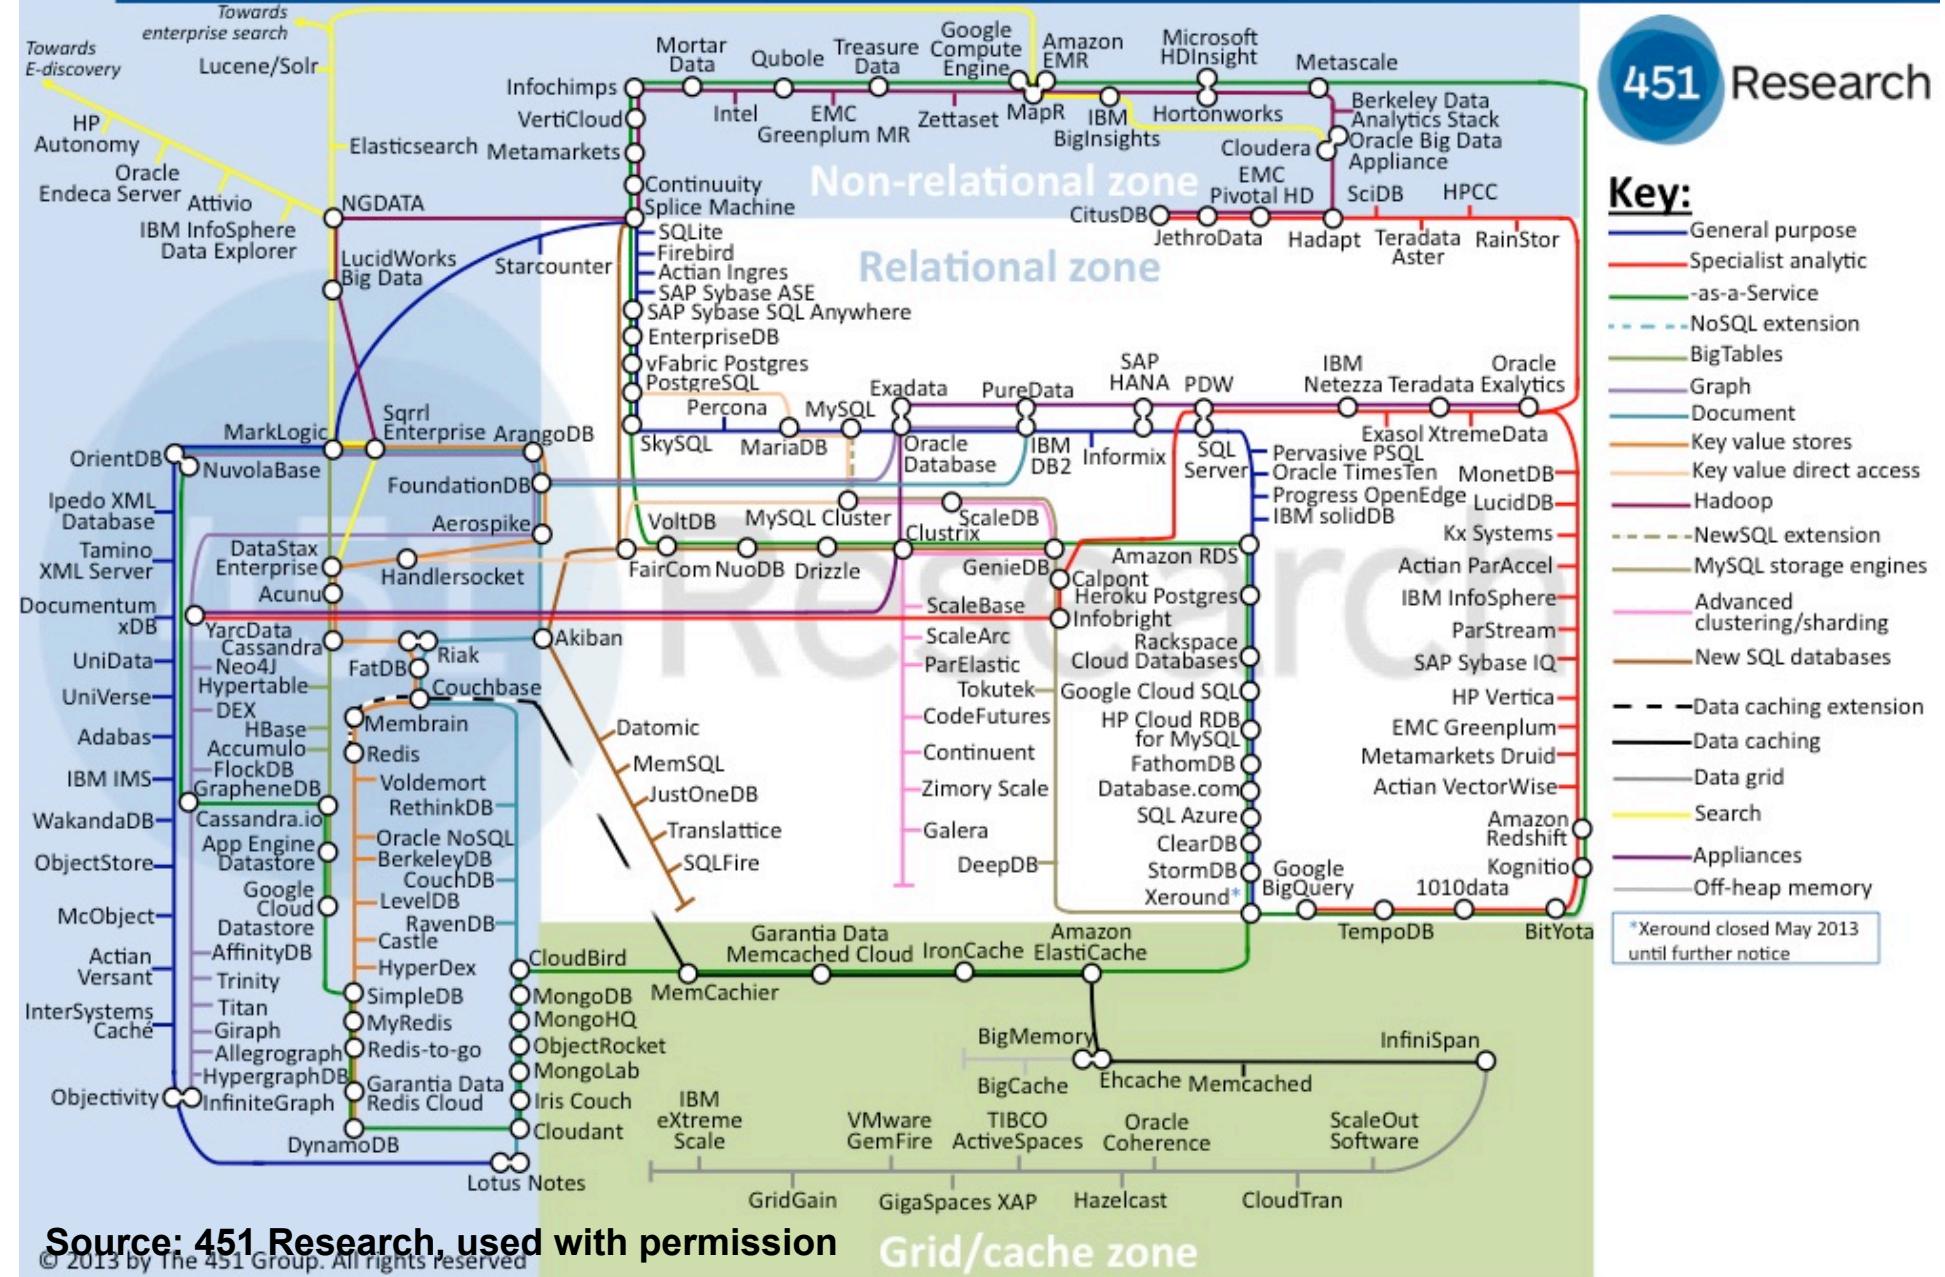

- Examples
 - Cassandra
 - Riak

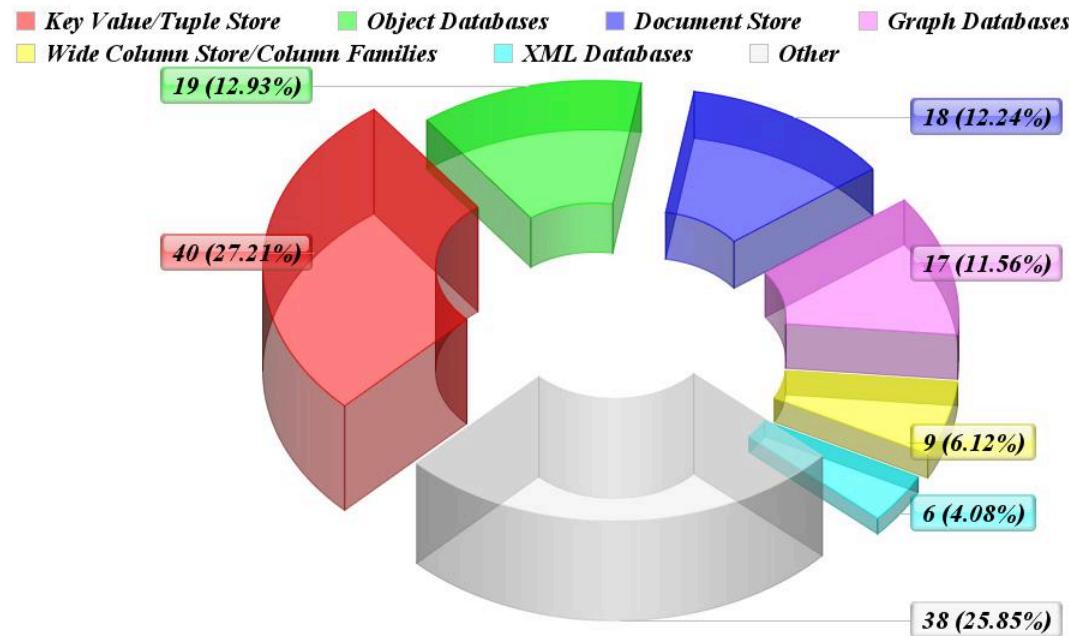

Database Landscape Map – June 2013

Key:

How many systems?

Source: <http://nosql-database.org/> (October 2013)

Choices, choices

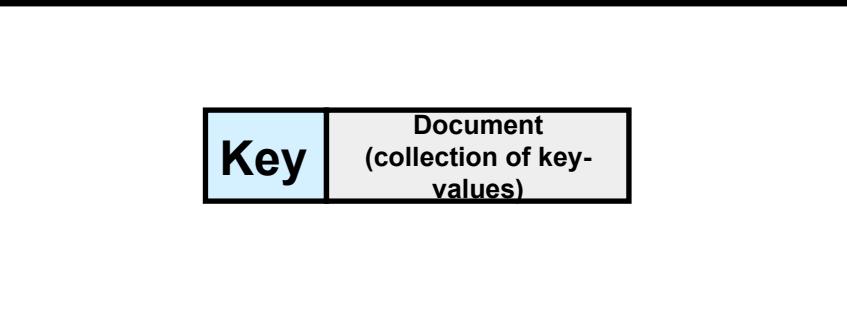

Major categories of NoSQL ...

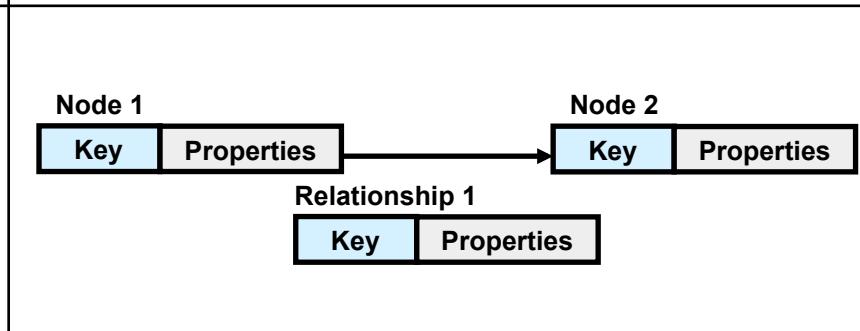

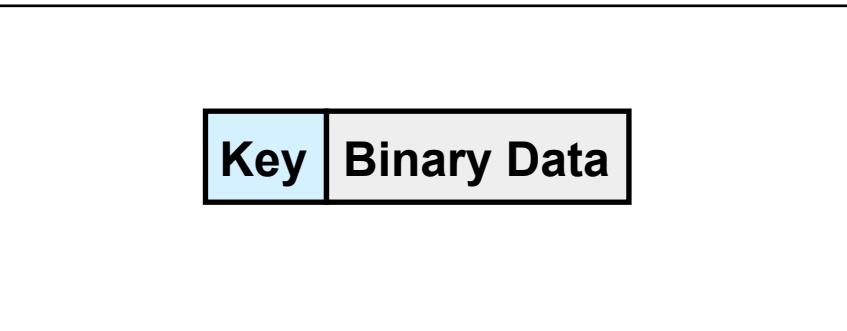

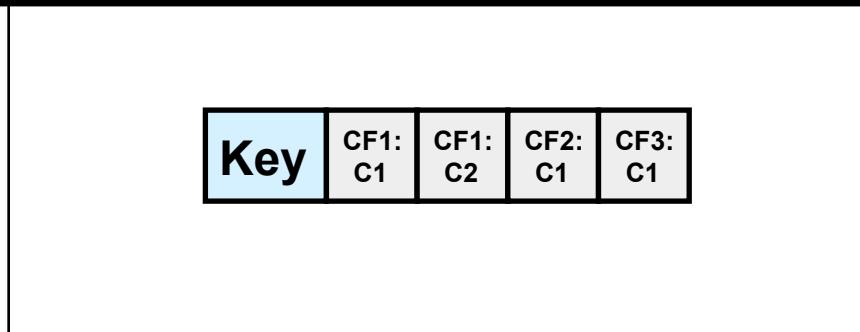

Type	Examples
Document store	 couchDB  mongoDB
Column store	 Cassandra  HBASE
Key-value store	 redis  riak
Graph store	 InfiniteGraph  Neo4j

Major categories of NoSQL

Document store

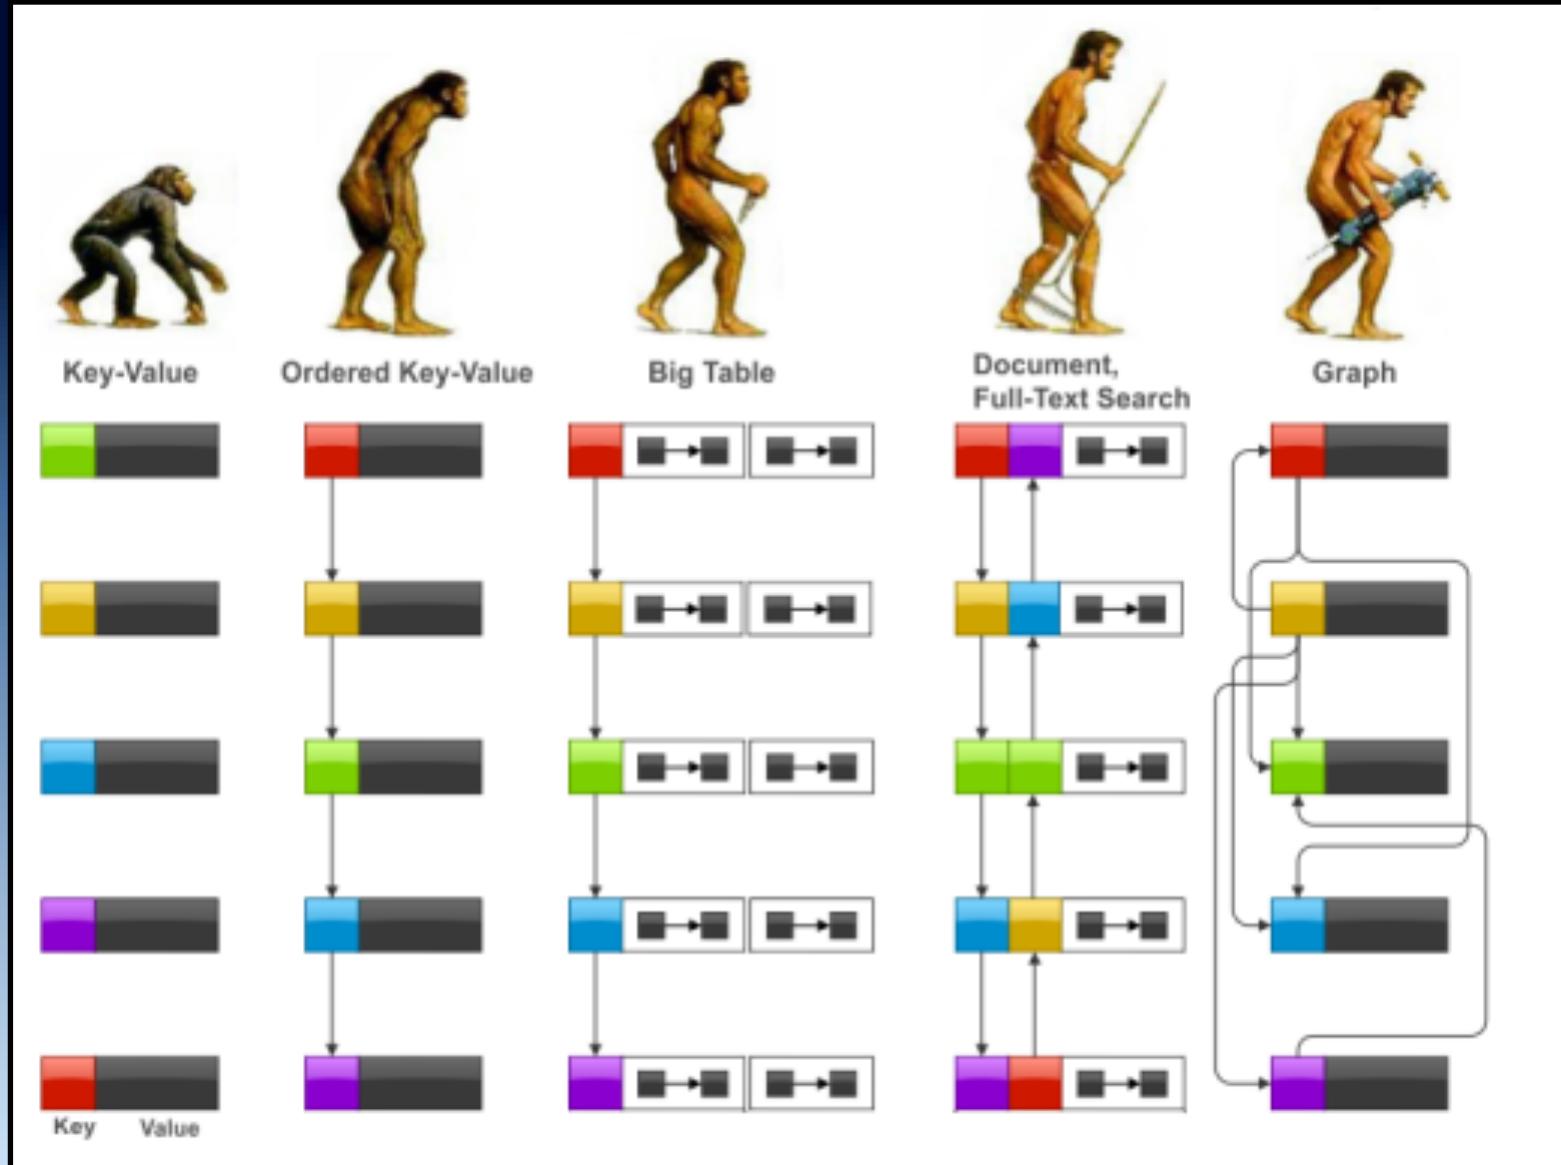

Column store

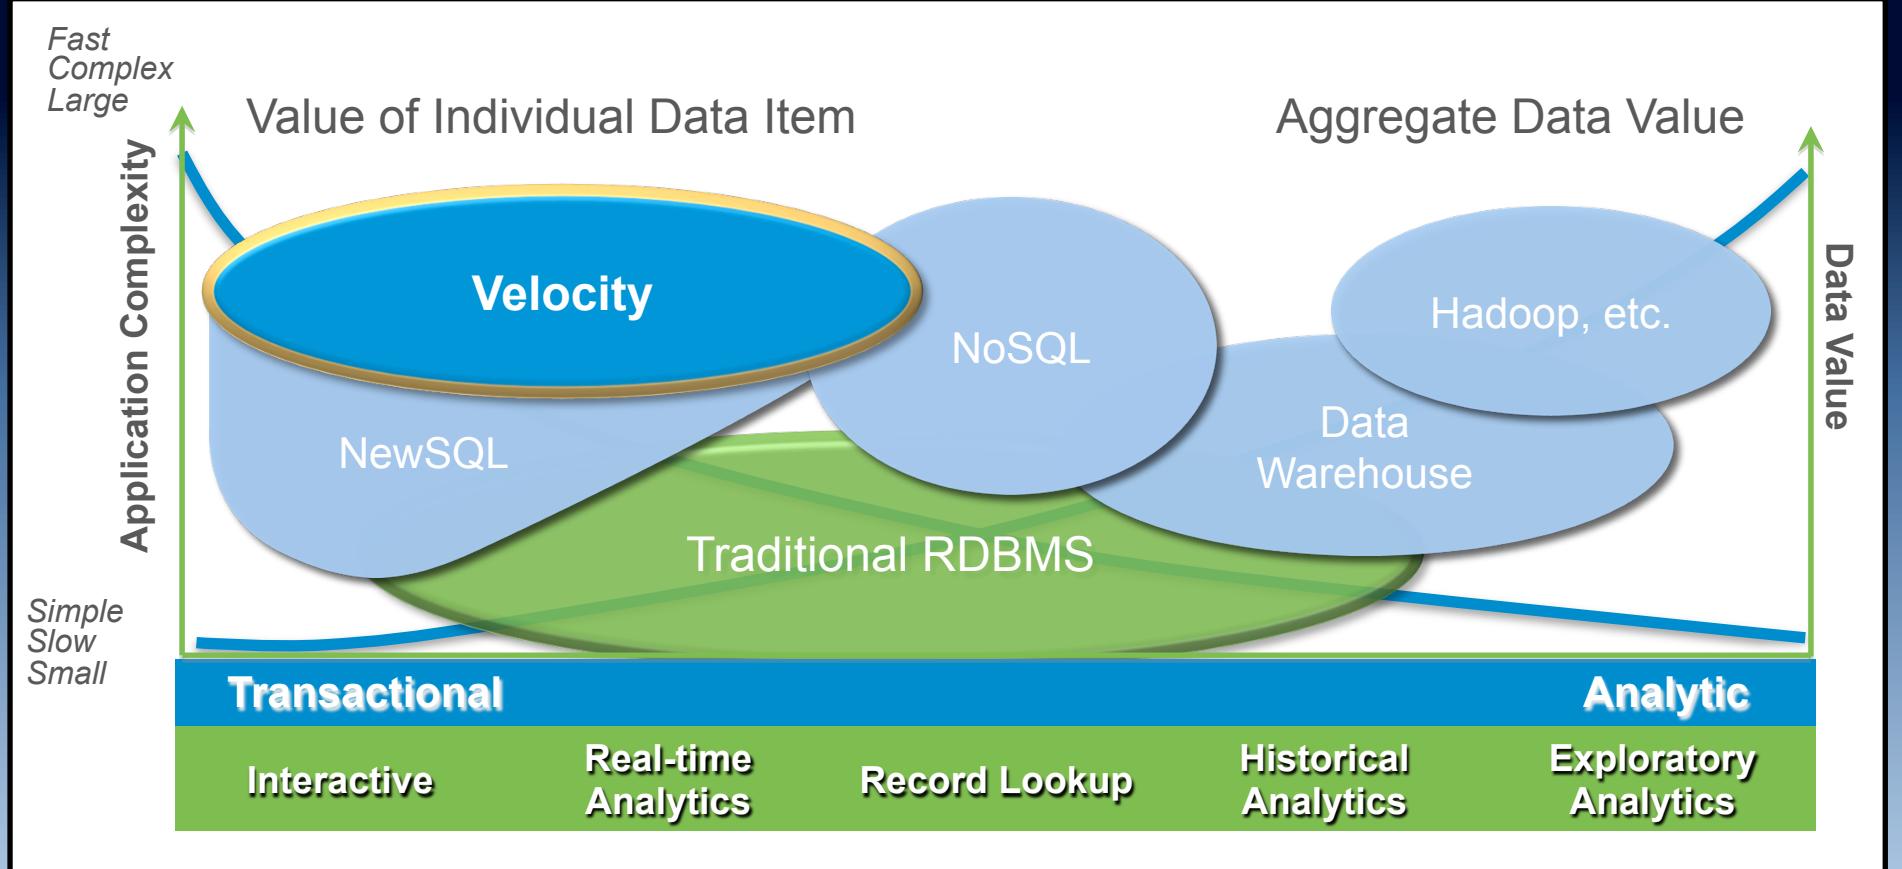

Key-value store

Graph store

History repeats
itself

The great debate ...

The great debate ...

About every ten years or so, there is a “great debate” between, on the one hand, those who see the problem of data modelling through a more or less relational lens, and on the other, a noisier set of “refuseniks” who have a hot new thing to promote. The debate usually goes like this:

The great debate ...

Refuseniks: Hah! You relational people with your flat tables and silly query languages! You are so unhip! You simply cannot deal with the problem of [INSERT NEW THING HERE]. With an [INSERT NEW THING HERE]-DBMS we will finish you, and grind your bones into dust!

The great debate

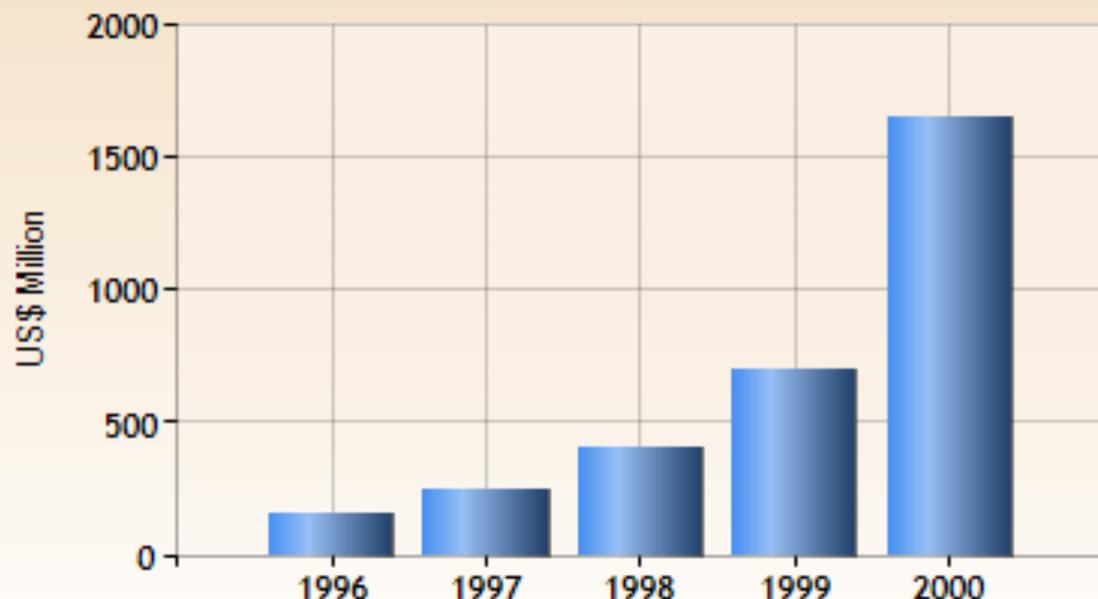

R-people: You make some good points. But unfortunately a) there is an enormous amount of money invested in building scalable, efficient and reliable database management products and no one is going to drop all of that on the floor and b) you are confusing DBMS engineering decisions with theoretical questions. We plan to incorporate the best of these ideas into our products.

Past proclamations of the imminent demise of relational technology

- Object databases vs. relational
 - GemStone, ObjectStore, Objectivity, etc.
- In-memory databases vs. relational
 - TimesTen, SolidDB, etc.
- Persistence frameworks vs. relational
 - Hibernate, OpenJPA, etc.
- XML databases vs. relational
 - Tamino, BaseX, etc.
- Column-store databases vs. relational
 - Sybase IQ, Vertica, etc.

[2] <http://snmaynard.com/2012/10/17/things-i-wish-i-knew-about-mongodb-a-year-ago/>

[3] <http://planetcassandra.org/blog/post/datastax-java-driver-for-apache-cassandra>

Reasons for OODB failure ...

- Relational “dies hard”
 - Tremendous investment in SQL skills and tools
 - Comfort factor
 - Nobody got fired for buying Relational
- Relational customers waited for OO support
 - ... or OO support simply not required
 - Growth in Object-Relational mapping and ORDBs
- Mismatch between OODBs and corporate data stores

Reasons for OODB failure ...

- Internal issues
 - Preferred database supplier
 - New developments postponed due to Y2K
- Proprietary query interfaces
- Poor standards support
- Lack of tools
- Lack of expertise
- Long-term risks

Reasons for OODB failure

Object-oriented database management could use a high-profile champion, but the realities are that revenue estimates for the ODBMS vendors are under \$50 million even for the largest (ODI), and all of them together have less revenue than Oracle spends on advertising.

-- Nelson H. King

Market analysis

NoSQL market size ...

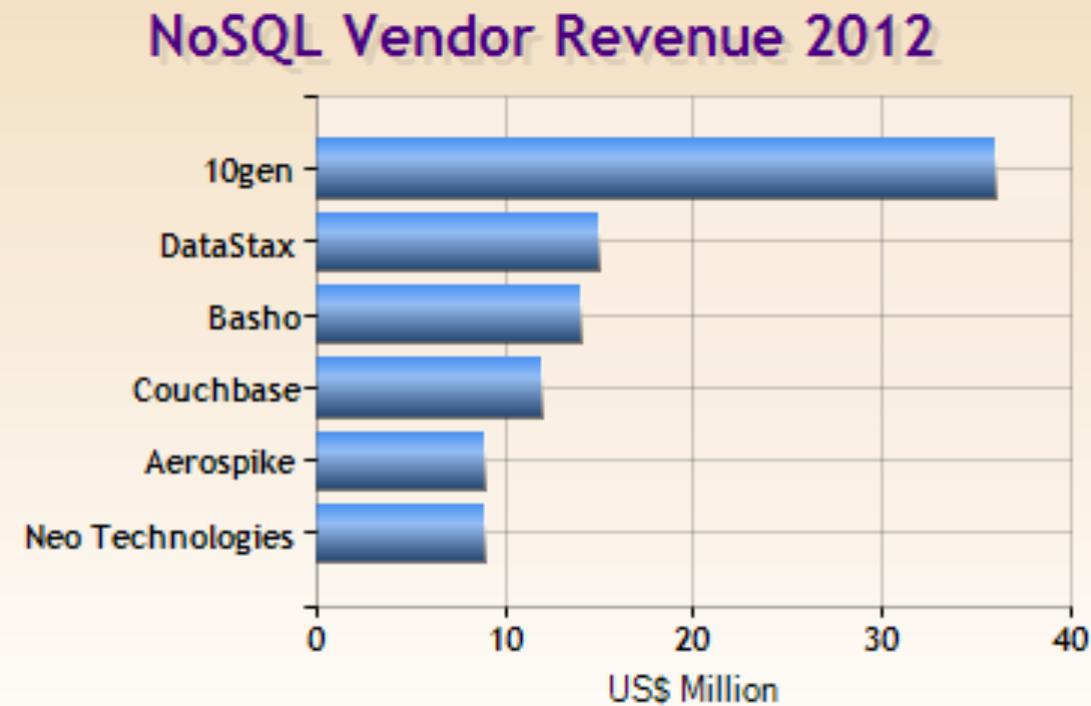

- Private companies do not publish results
- Venture Capital (VC) funding 10s/100s of millions of US \$^[1]
- NoSQL software revenue was US \$20 million in 2011^[2]

[1] http://blogs.the451group.com/information_management/2011/11/15/

Polyglot persistence

Source: Heroku, used with permission

Polyglot persistence

Source: Adapted from <http://martinfowler.com/bliki/PolyglotPersistence.html>

Polyglot persistence examples

- Disney
 - Cassandra, Hadoop, MongoDB
- Interactive Mediums
 - CouchDB, MySQL
- Mendeley
 - HBase, MongoDB, Solr, Voldemort
- Netflix
 - Cassandra, Hadoop/HBase, RDBMS, SimpleDB
- Twitter
 - Cassandra, FlockDB, Hadoop/HBase, MySQL

Polyglot persistence

- NoSQL product specialization requires developer knowledge and skills for each platform
- Different APIs
 - Develop public API for each NoSQL store (Disney)

Public API for NoSQL store

In some cases, the team decided to hide the platform's complexity from users; not to facilitate its use, but to keep loose-cannon developers from doing something crazy that could take down the whole cluster. It could show them all the controls and knobs in a NoSQL database, but “they tend to shoot each other,” Jacob said. “First they shoot themselves, then they shoot each other.”

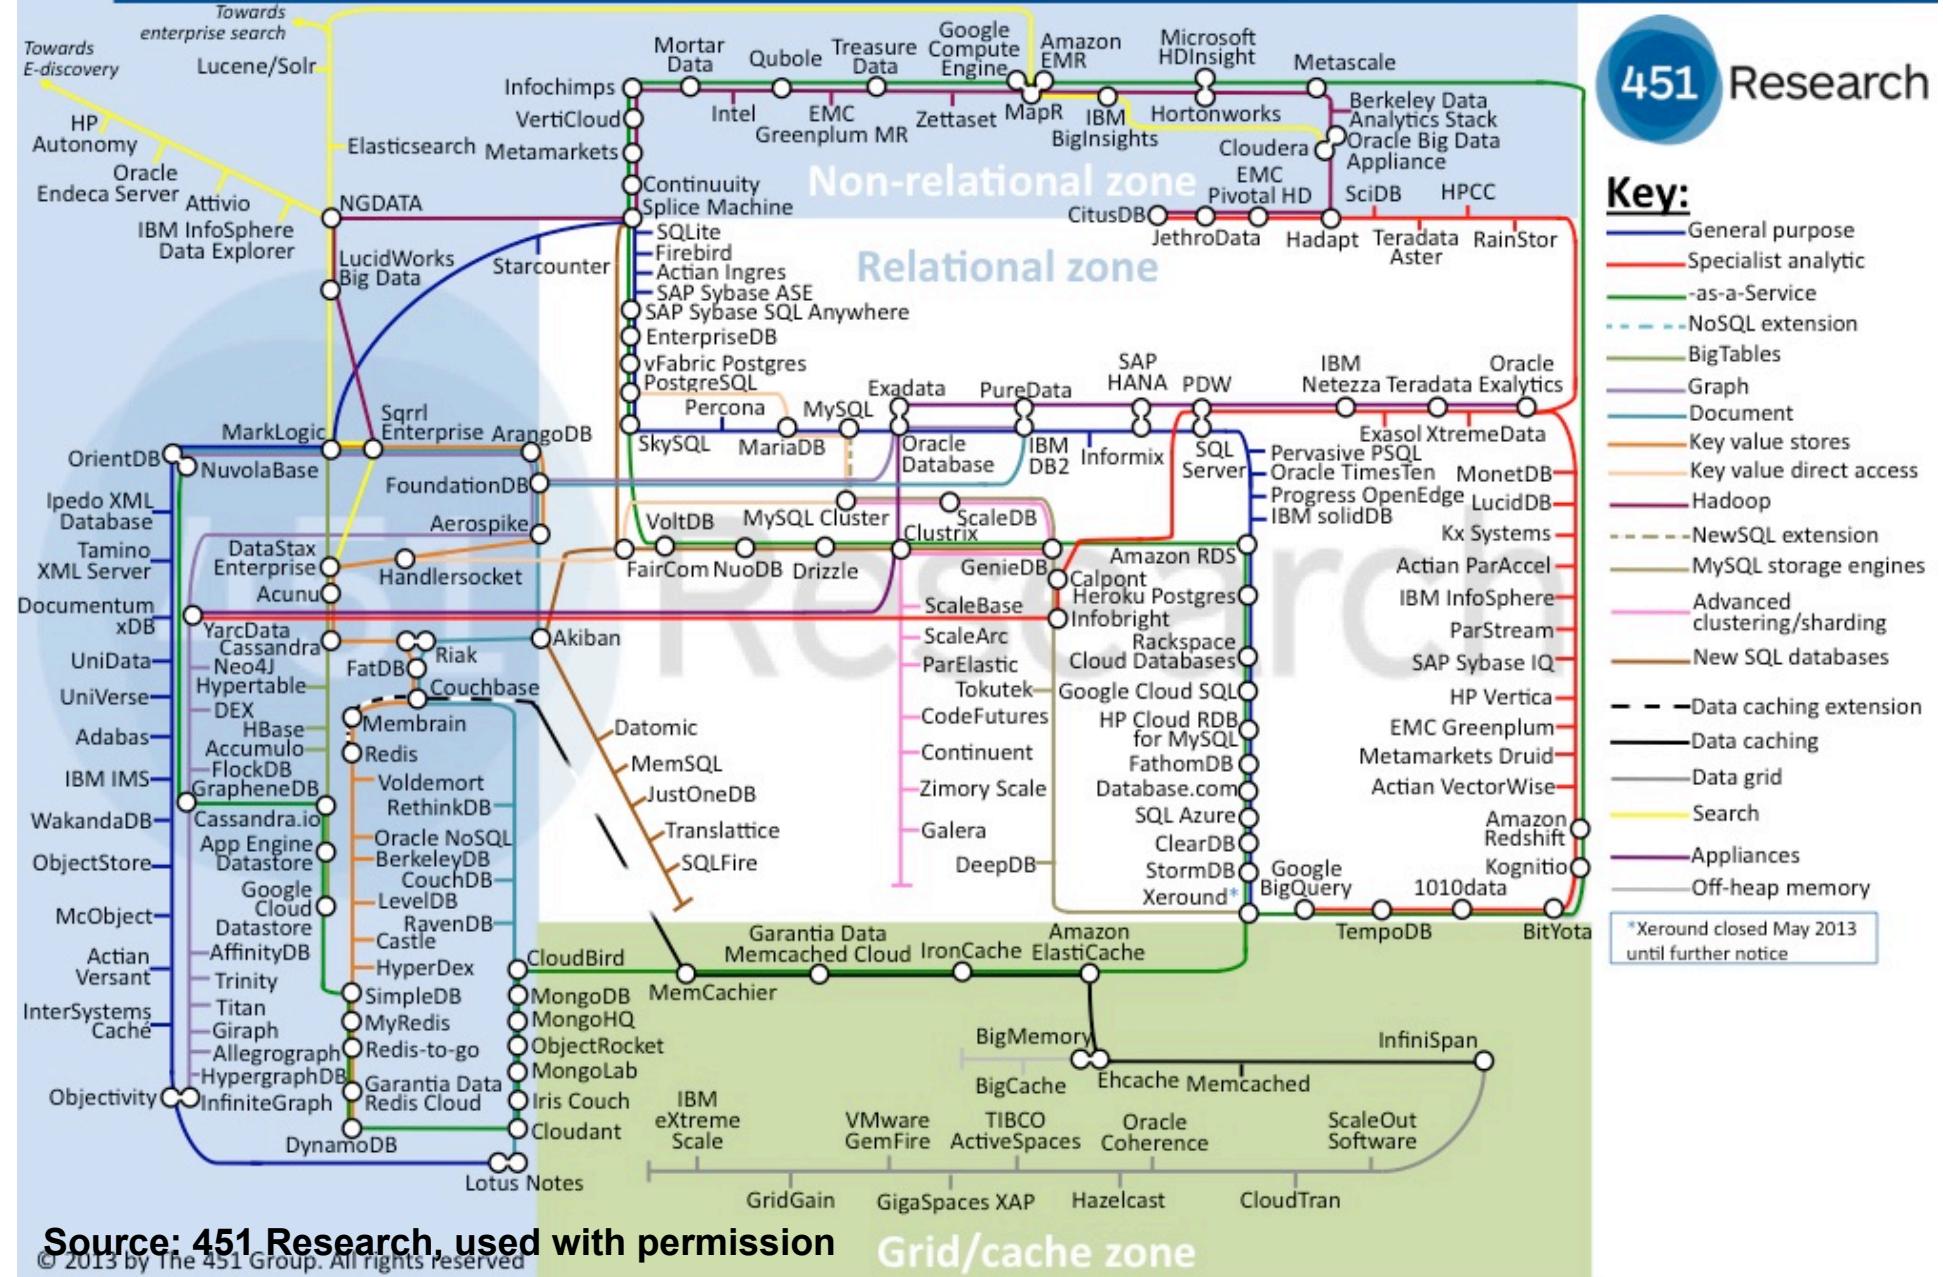

NoSQL alternatives

Database Landscape Map – June 2013

Key:

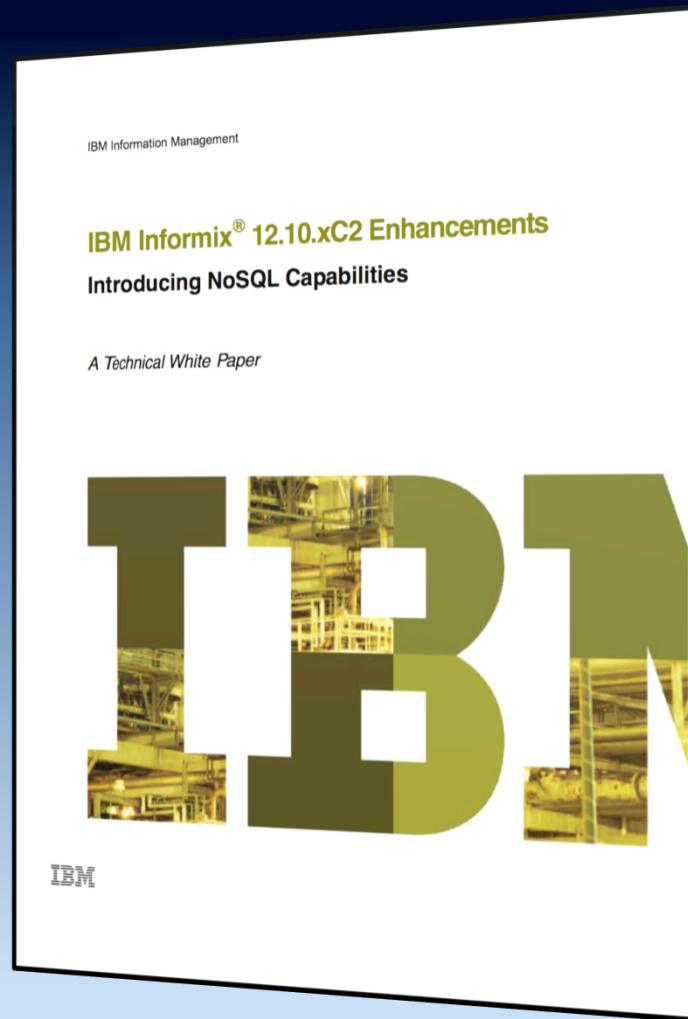

NewSQL

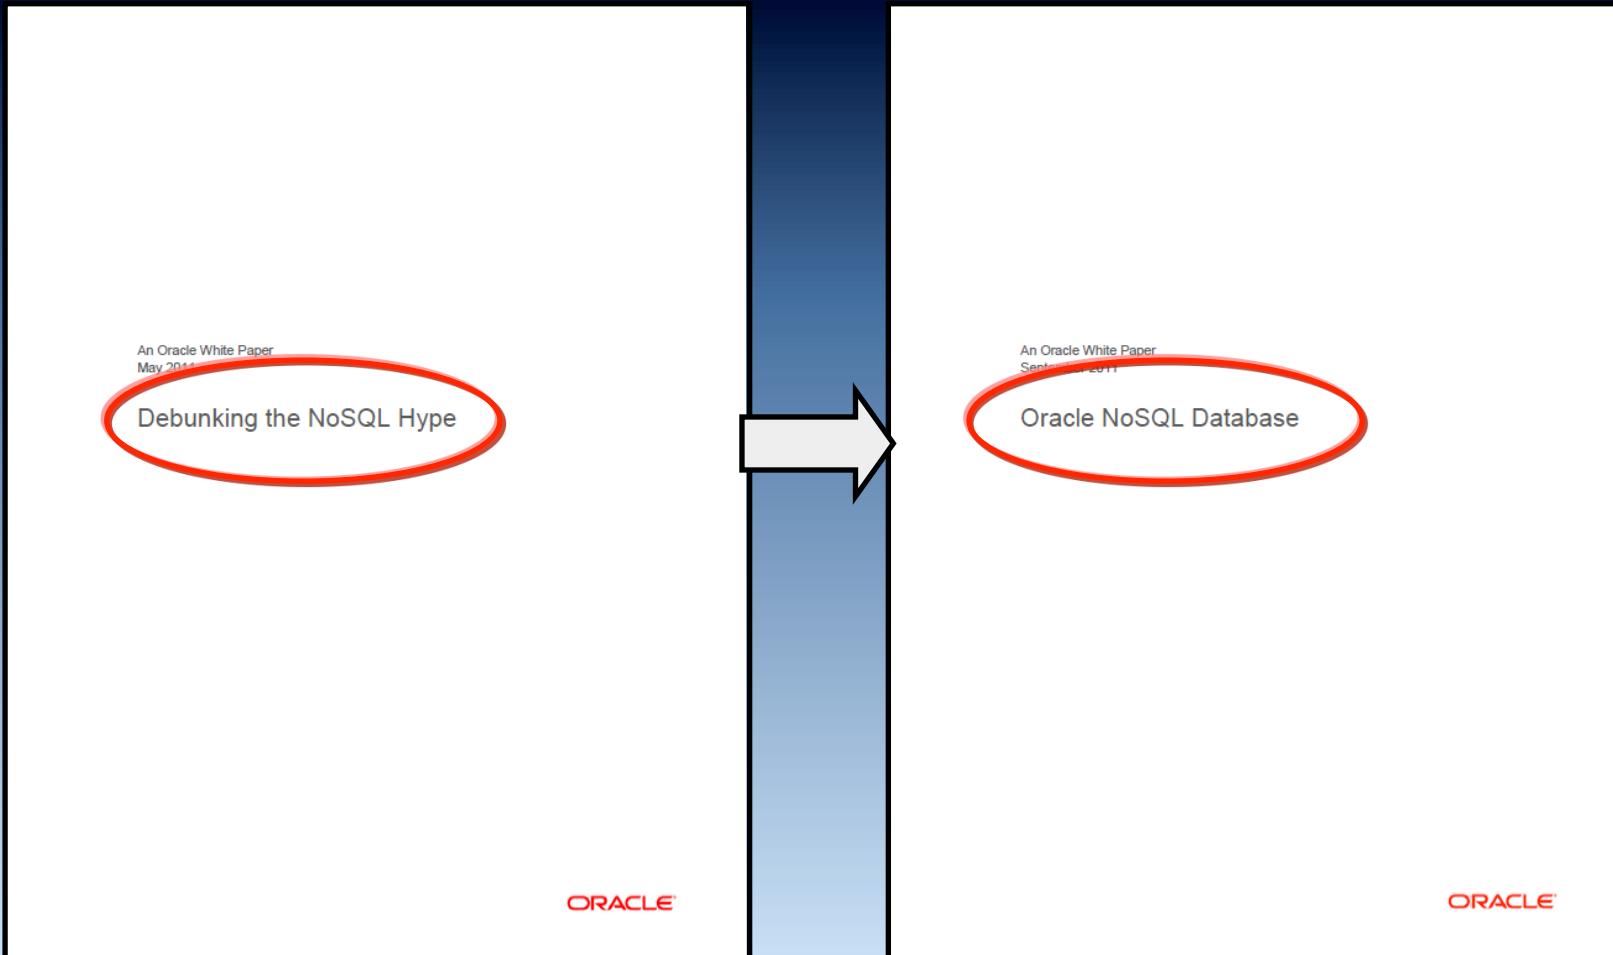

- Today, new challenges and requirements
 - “Web changes everything”
- Need more OLTP throughput
- Need real-time analytics
- ACID support
- Preserve SQL
 - Automatic query optimization
- Preserve investment
 - Existing skills and tools

Relational

- Vendors adding NoSQL capabilities
 - Documents (JSON)
 - Linked data (RDF)

What about Oracle?

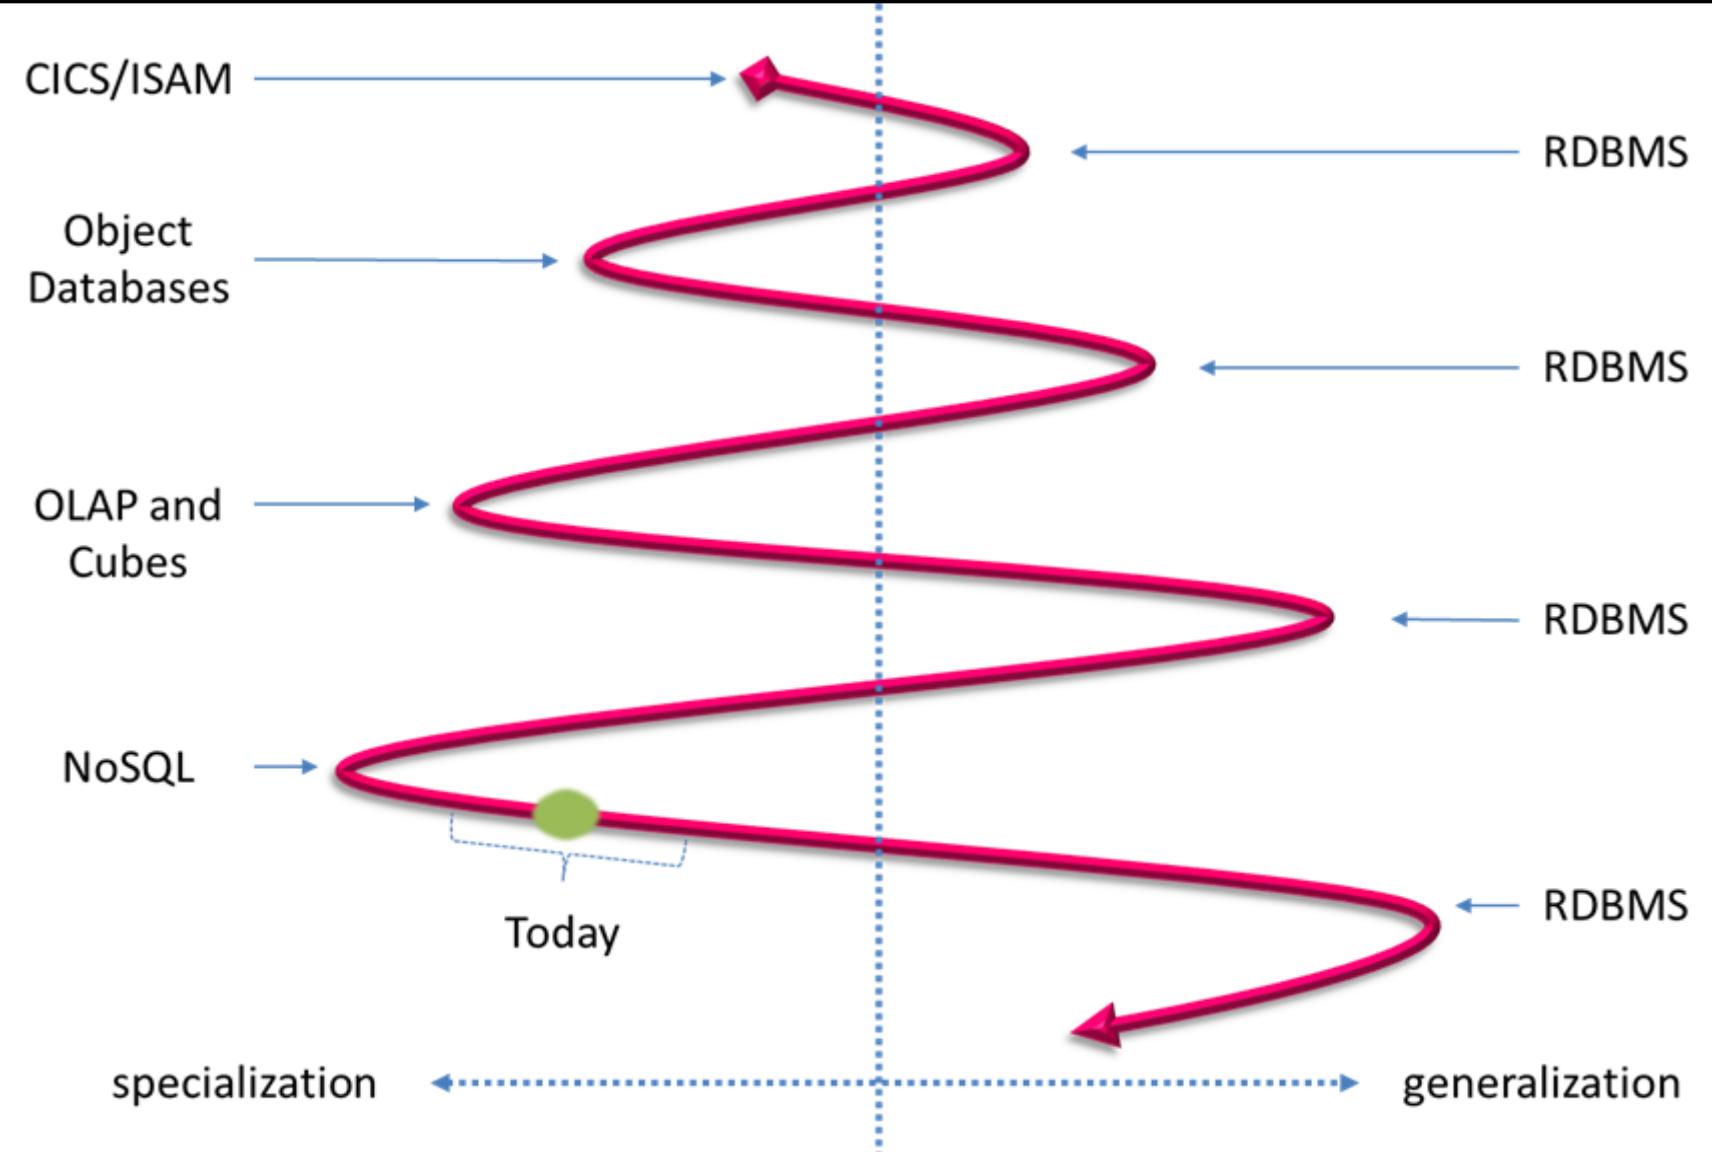

Future directions

- Internal polyglot support
- Multi-model systems
- Google F1-inspired systems
 - “Can you have a scalable database without going NoSQL? Yes.”
- Further support for NoSQL in Relational
- DBaaS
- Orchestrate.io
 - “The Next Big Thing”?

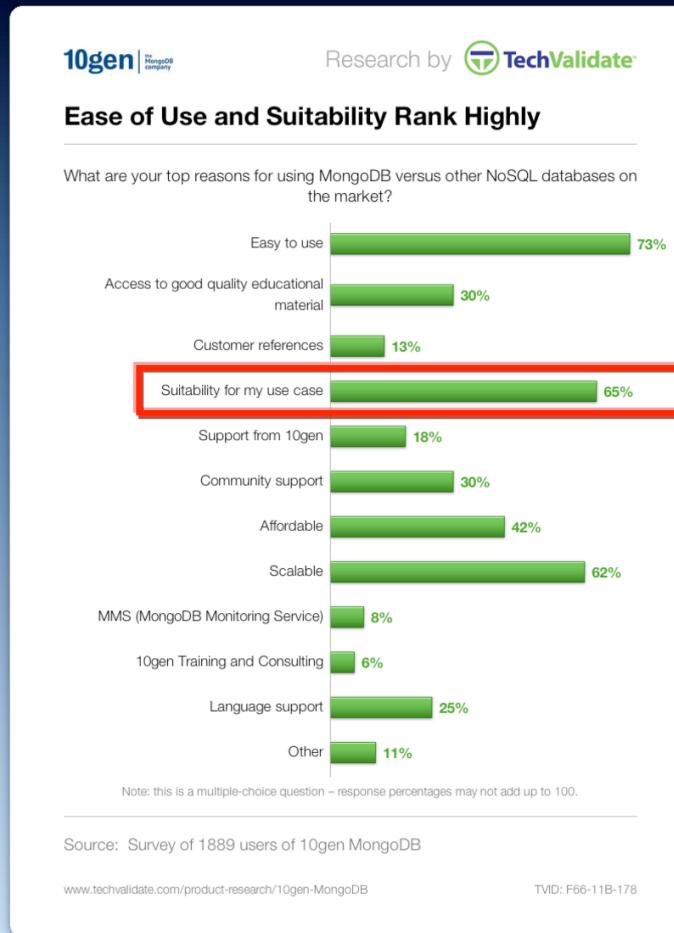

Summary

Understand your use case

Source: <http://www.techvalidate.com/tvid/F66-11B-178/>

Understand vendor-speak

What vendor says	What vendor means
The biggest in the world	The biggest one we've got
The biggest in the universe	The biggest one we've got
There is no limit to ...	It's untested, but we don't mind if you try it
A new and unique feature	Something the competition has had for ages
Currently available feature	We are about to start Beta testing
Planned feature	Something the competition has, that we wish we had too, that we might have one day
Highly distributed	International offices
Engineered for robustness	Comes in a tough box
